

EECP Therapy

Description

Enhanced external counterpulsation (EECP) is a noninvasive treatment modality which can increase arterial blood flow in peripheral and coronary arterial disease.

EECP has been used on patients suffering from erectile dysfunction (ED). Patients reported a significant improvement of penile rigidity after completion of the EECP treatment and a significant improvement of penile peak systolic flow was measured by Doppler sonography. No adverse effects have been observed. For most men, EECP seems to be an effective treatment modality for patients with ED.

Protocol

Administered by a trained EECP technician during 45 minute sessions
